

# HEALTHCONNECT CLINIC

Week 6 — Project Summary

## Key Results

| Metric / Finding                               | Result               |
|------------------------------------------------|----------------------|
| Attendance Rate                                | 46.28%               |
| No-Show Rate                                   | 48.46%               |
| Cancelled                                      | 5.26%                |
| Follow-up No-Show Rate                         | 51.23%               |
| No-Show Rate — Attended vs No-Show             | 51.15%               |
| Highest overall reminder-category no-show rate | No Reminder — 51.39% |

## Advanced Findings

- Previous no-show history shows an upward no-show pattern, with the five-previous-no-show group reaching approximately 97% in the displayed analysis.
- Follow-ups have the highest appointment-type no-show rate at 51.23%.
- Reminder patterns differ by appointment type, so channel performance should be evaluated by segment.
- No Reminder has the highest overall no-show rate in the displayed reminder matrix at 51.39%.
- The Data Science cross-check found an approximately five-point reminder difference after excluding 263 Cancelled appointments, smaller than the effect initially observed in the broader analysis.

## Validated Conclusion

Week 6 supports targeted attention to repeated no-show patients, follow-up appointments, and reminder coverage. It also shows that outcome definitions materially affect estimated rates, so future analysis should clearly distinguish all-outcome KPIs from Attended-versus-No-show KPIs.

## Recommended Actions

- Target patients with repeated previous no-shows.
- Improve reminder coverage and monitor outcomes by channel.
- Investigate the operational causes of elevated follow-up no-shows.
- Avoid interpreting reminder differences as causal without further testing.
- Keep distance and waiting time as secondary variables unless new evidence shows stronger relationships.

## Week 7 Priorities

- Validate previous no-show and follow-up patterns on additional data.
- Standardize reminder-effectiveness definitions across tracks.
- Monitor KPI accuracy and trends.
- Feed validated analytical findings to Data Science for modelling decisions.
